

ABSTRACT OF THE DISCLOSURE

[00023] A conveyor system for a powder paint spray booth including spaced continuous parallel first and second moving belts supported by a plurality of spaced rollers enclosed within a sealed housing and a powder paint collector located
5 below the powder paint spray booth which receives powder paint from between the sealed housings. The continuous belts are formed of stainless steel each having a width of less than ten inches and grating is provided between the housings permitting personnel to walk over the conveyor system without damaging the stainless steel belts. The collector system includes a V-shape baffle having an apex located between the conveyor housings
10 directing powder paint into collectors on opposed sides of the conveyor units.
